Chapter 1

Introduction

This document lists and gives some background information on the C-language example UM programs.

For policies and procedures related to Ultra Messaging Technical Support, see UM Support.

See **UM Glossary** for Ultra Messaging terminology, abbreviations, and acronyms.

1.1 C Examples Introduction

These programs were written to help in troubleshooting, testing, and demonstrating UM coding techniques. See also Java Example Source Code and C# Example Source Code.

Since the tools are written to be useful as well as instructive, they are more complex than purely-instructive examples would be, with many options to add or subtract functionality. See UMExamples for purely-instructive examples of a variety of UM use cases.

The example C programs listed here are provided in both source form and in binary executable form.

1.2 Configuring C Examples

The example programs universally provide the "-c filename" command-line option. Using that option, the example application calls the **lbm_config()** API. However, note that this API is not recommended for use with XML-format LBM configuration files, largely because you are not able to specify an application name.

To use an XML configuration file with a UM example application, set the environment variables:

- LBM XML CONFIG APPNAME Desired name of application.
- LBM XML CONFIG FILENAME Path name of XML configuration file.

In this way, UM will correctly set the example application's name and will properly load the XML configuration file.

1.3 Building C Examples

Most users are not interested in compiling these sources in their current form, but instead use them for "spare parts", extracting fragments of code as appropriate. For users who wish to build the tools, and especially for users who may want to modify the tools, we recommend creating a new directory and copying all of the doc/example directory contents into that new directory.

The documentation below includes example build commands that have been tested on Linux. Note that the environment variable "LBM" should be set to the platform-specific UM directory that contains the "include" and "lib" directories. For example:

```
LBM=$HOME/UMP_6.15/Linux-glibc-2.17-x86_64
```

For windows builds, use the Unix build line to show the required libraries for each application.

1.4 Unhandled C Events

Each of the example programs is written to demonstrate a subset of UM's total available functionality. For example, some programs are written to demonstrate **Streaming** functionality (e.g. lbmsrc), while other programs are written to demonstrate **Persistence** functionality (e.g. umesrc), while still other programs are written to demonstrate **Queuing** functionality (e.g. umqsrc).

UM is generally designed to be event-driven, with events being delivered to the programs through standard call-backs, like source callbacks and receiver callbacks. There are many events which are common across all streaming, persistence, and queuing. Other events are specific to persistence, and still other events are specific to queuing.

This can lead to example programs reporting "unknown" or "unhandled" events. For example, if the "lbmsrc" streaming program is run with a configuration file that enables persistence, UM will deliver events that are specific to persistence to the "lbmsrc" program. But "lbmsrc" is designed for streaming, and does not include code cases for persistence or queuing events. Maybe you should change your configuration to disable persistence, or you should be using the "umesrc" example program.

Similarly, the "umqsrc" program expects queuing functionality, and can report unhandled events if persistence is configured. Or "umesrc" can report unhandled events if queuing is configured.

If you see an unhandled event, it is generally reported as a number. You can see which event this corresponds to by looking up the number in:

· C Receiver Events for subscribing programs and

· C Source Events for publishing programs.

Once you understand the nature of the unhandled event, you can decide how to change your configuration or choose a different program.

1.5 C Example Support Files

There are several source files in the example directory that contain useful functions to the main example programs.

```
getopt.c - utility functions to parse command-line options (for Windows).
```

verifymsg.c - utility function to help some programs create verifiable messages.

monmodopts.h - common include file used by many of the example programs. It includes option information for monitoring functionality.

replgetopt. **h** - common include file used by many of the example programs. It includes definitions for alternate getopt functions.

verifymsg.h - common include file used by many of the example programs. It includes definitions for "verifymsg.c" (which needs to be linked into many programs).

```
srs_monitor_info_msg.c - Module used by the srs_monitor_info_receiver program.
srs_monitor_info_msg.h - Definitions for srs_monitor_info_msg.c module.
```

srs_cmd_msg.c - Module used by the srs_cmd program.

status.c - Module used by the "Ibmlatping" and "Ibmlatpong" programs.

```
srs_cmd_msg.h - Definitions for srs_cmd_msg.c module.
```

lbmmondiag.pl - Reads UDP packets and process statistics. See lbmmonudp.c and lbmmondiag.pl in the UM Operations Guide.

1.6 Persistence Tutorial C Files

See **Demonstrating Persistence** for information on these files.

```
ume-example-src.c - Initial source application used in the tutorial.
ume-example-rcv.c - Initial receiver application used in the tutorial.
ume-example-src-2.c - Source application modified to use a UMP persistent store.
ume-example-rcv-2.c - Receiver application modified to use a UMP persistent store.
ume-example-src-3.c - Modified source application used to demonstrate persistence.
ume-example-rcv-3.c - Modified receiver application used to demonstrate persistence.
ume-example-config.xml - Elementary persistent store configuration file used for the tutorial.
```

1.7 C Examples

1.7.1 Example Ibmhfrcv.c

```
Example build:
```

```
qcc lbmhfrcv.c verifymsq.c -o lbmhfrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
   -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmhfrcv.c
Purpose: application that receives messages from a given topic using a single
   hot-failover receiver.
Usage: lbmhfrcv [-AEhsvV] [-c filename] [-r msgs] [-U losslev] topic
       -A = display messages as ASCII text
       -c filename = Use LBM configuration file filename.
                    Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -d, --msec-delay=NUM
                                  Implements a number of milliseconds sleep per
          message received
       -E = exit after source ends
       -h = help
       -r msgs = delete receiver after msgs messages
       -s = print statistics along with bandwidth
       -S = Exit after source ends, print throughput summary
       -v = be verbose about incoming messages (-v -v = be even more verbose)
       -V = verify message contents
1.7.2 Example Ibmhfrcvq.c
```

Example build:

```
gcc lbmhfrcvq.c verifymsg.c -o lbmhfrcvq -I$LBM/include -I$LBM/include/lbm -L$LBM/
   lib -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmhfrcvq.c
Purpose: lbmhfrcv.c: application that receives messages from a given topic
    using a single hot-failover receiver and an event queue.
Usage: lbmhfrcvq [-EhsvV] [-c filename] [-r msgs] [-U losslev] topic
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -E = exit after source ends
       -h = help
       -r msgs = delete receiver after msgs messages
       -s = print statistics along with bandwidth
       -S = Exit after source ends, print throughput summary
       -U losslev = exit after losslev % unrecoverable loss
       -v = be verbose about incoming messages (-v -v = be even more verbose)
       -V = verify message contents
```

1.7.3 Example Ibmhfsrc.c

```
Example build:
```

```
qcc lbmhfsrc.c verifymsq.c -o lbmhfsrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
                -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmhfsrc.c
Purpose: application that sends to a given topic using a single hot-failover
Usage: lbmhfsrc [options] topic
Available options:
         -c filename = Use LBM configuration file filename.
                                                                     Multiple config files are allowed.
                                                                     Example: '-c file1.cfg -c file2.cfg'
         -d delay = delay sending for delay seconds after source creation
         -h = help
         -i init = start at message init instead of 0
         -1 len = send messages of len bytes
         -L linger = linger for linger seconds before closing context
        -M msgs = send msgs number of messages
       -N NUM = send on channel NUM
        -P msec = pause after each send msec milliseconds
         -R [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                                                                                          {\tt DATA} bits per second, and set retransmit rate limit to
                                                                                          RETR bits per second. For both limits, the optional
                                                                                           k, m, and g suffixes may be used. For example,
                                                                                            ^\prime\text{-R} 1m/500k' is the same as ^\prime\text{-R} 1000000/500000'
         -s sec = print stats every sec seconds
          -t filename = use filename contents as a recording of message sequence numbers
         -V = construct verifiable messages
         -x bits = Use 32 or 64 bits for hot-failover sequence numbers
1.7.4 Example Ibmhfxrcv.c
Example build:
\verb|gcc lbmhfxrcv.c verifymsg.c -o lbmhfxrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/include/lbm -L$LBM/inc
               lib -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmhfxrcv.c
Purpose: application that receives messages from a given topic using a single
                hot-failover receiver across contexts (HFX).
Usage: lbmhfxrcv [-aACdEfhqsSvV] [-I interface] [-c filename] [-r msgs] [-U
               losslev] topic
Available options:
         -a, --arrival-order deliver messages in the order that they arrive.
         -A, --ascii
                                                                           display messages as ASCII text (-A -A = newlines after each
                       msq)
         -c, --config=FILE Use LBM configuration file FILE.
                                                                                                  Multiple config files are allowed.
                                                                                                  Example: '-c file1.cfg -c file2.cfg'
         -C, --context-stats % \left( -\right) =\left( -\right) \left( -\right) =\left( -\right) \left( -
```

-d, --deliver-dups Enable duplicate delivery

exit when source stops sending

display this help and exit

-E, --exit

-h, --help

-I, --iface=CIDR create a context on the interface specified by CIDR Multiple interfaces are allowed. Example: '-I 10.29.1.0/24 -I 10.29.2.0/24' use an LBM event queue -q, --eventq -r, --msgs=NUM exit after NUM messages -O, --orderchecks Enable message order checking -s, --stats=NUM print LBM statistics every NUM seconds --max-sources=NUM allow up to NUM sources (for statistics gathering purposes) -S, --stop exit when source stops sending, and print throughput summary -U, --losslev=NUM exit after NUM% unrecoverable loss -v, --verbose be verbose about incoming messages (-v -v = be even more verbose) verify message contents -V, --verify Monitoring options: --monitor-rcv=NUM monitor receiver every NUM seconds monitor context every NUM seconds --monitor-ctx=NUM use monitor transport module TRANS --monitor-transport=TRANS TRANS may be 'lbm', 'lbmsnmp', or 'udp', default is 'lbm' --monitor-transport-opts=OPTS use OPTS as transport module options --monitor-format=FMT use monitor format module FMT FMT may be 'csv' or 'pb' --monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string Transport and format options are passed as name=value pairs, separated by a semicolon. The entire option string should be enclosed in double-quotes. LBM transport options: Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name The vertical bar (pipe symbol) is required when specifying individual LBM options. config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics VAL may be 'off' or 'on' allow_debug=VAL defaults to 'off' LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

send statistics to address IP address=IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

```
PB format options:
filters=FILE use FILE that contains filter options
```

1.7.5 Example Ibmhtrcv.c

Example build:

```
gcc lbmhtrcv.c -o lbmhtrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: lbmhtrcv.c
Purpose: application that receives from a collection of HyperTopic patterns.
Usage: lbmhtrcv [options] <patterns_file</pre>
Where 'patterns_file' is a simple text file, supplied as standard input,
     containing one pattern per line.
Available options:
 -d msec
                        delete hypertopic receiver every msec milliseconds
 -h, --help
                       display this help and exit
                       set hypertopic prefix to string
  -p string
 -q
                       use event queue
                      print statistics along with bandwidth
  -s, --statistics
  -v, --verbose
                      be verbose about incoming messages
  -x
                       exit after all receivers deleted
```

1.7.6 Example Ibmimsg.c

Example build:

```
gcc lbmimsg.c -o lbmimsg -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: lbmimsq.c
Purpose: application that sends immediate messages (either unicast or multicsat)
    as fast as possible, either to a topic, or send topicless.
Usage: lbmimsg [options] topic
      lbmimsg [options] -o
Available options:
  -c filename = Use LBM configuration file filename.
                Multiple config files are allowed.
                Example: '-c file1.cfg -c file2.cfg'
  -d delay = delay sending for delay seconds after source creation
  -h = help
  -1 len = send messages of len bytes
  -L linger = linger for linger seconds before closing context
  -M msgs = send msgs number of messages
 -n num = Append a number between 1 and num to topic
  -o = send topic-less immediate messages
  -P msec = pause after each send msec milliseconds
  -R [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                     DATA bits per second, and set retransmit rate limit to
                     RETR bits per second. For both limits, the optional
```

```
k, m, and g suffixes may be used. For example, '\text{-R 1m/500k'} is the same as '-R 1000000/500000'-T target = target for unicast immediate messages
```

1.7.7 Example Ibmireq.c

Example build:

```
gcc lbmireq.c -o lbmireq -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: lbmireq.c
Purpose: application that sends immediate message requests (multicast or unicast)
    to a given topic and waits for responses.
Usage: lbmireq [-hv] [-c filename] [-l len] [-L linger] [-P sec] [-r rate/pct]
       [-R requests] [-T target] [topic]
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -h = help
       -1 len = send messages of len bytes
       -L linger = linger for linger seconds before closing context
       -P sec = pause sec seconds after sending request for responses to arrive
       -r [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                          DATA bits per second, and set retransmit rate limit to
                          RETR bits per second. For both limits, the optional
                          k, m, and g suffixes may be used. For example,
                          '-r 1m/500k' is the same as '-r 1000000/5000000'
       -R requests = number of request messages to send
       -T target = send immediate request to target
       -v = be verbose (-v - v = be even more verbose)
```

1.7.8 Example lbmlatping.c

Example build:

1.7.9 Example Ibmlatpong.c

```
Example build:
```

1.7.10 Example Ibmmon.c

Example build:

```
gcc lbmmon.c -o lbmmon -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm
    -lm -lrsock -lprotobuf-c
gcc lbmmon_cmd.c -o lbmmon_cmd -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmmon.c
Purpose: example LBM statistics monitoring application.
Usage: lbmmon [options]
Available options:
  -c, --config=FILE
                             Use LBM configuration file FILE.
                             Multiple config files are allowed.
                             Example: '-c file1.cfg -c file2.cfg'
                             display this help and exit
  -h, --help
  -t, --transport=TRANS
                             use transport module TRANS
                             TRANS may be 'lbm', 'udp', or 'lbmsnmp', default is
                                 `lbm'
      --transport-opts=OPTS use OPTS as transport module options
                             See the 'UM Operations Guide' section 'Monitoring
                                Transport Modules'.
  -f, --format=FMT
                             use format module FMT
                             FMT may be 'csv' or 'pb'
      --format-opts=OPTS
                             use OPTS as format module options
                             See the 'UM Operations Guide' section 'Monitoring
                                 Format Modules'.
```

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

```
LBM transport options:
```

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC receive statistics on topic TOPIC default is /29west/statistics

wctopic=PATTERN receive statistics on wildcard topic PATTERN

See https://communities.informatica.com/infakb/faq/5/Pages/

80075.aspx

for guidelines on using wildcard topics. Also make sure

the statistics

topic namespace is disjoint from the data topic namespace.

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC receive statistics on topic TOPIC default is /29west/statistics

wctopic=PATTERN receive statistics on wildcard topic PATTERN

See https://communities.informatica.com/infakb/faq/5/Pages/

80075.aspx

for guidelines on using wildcard topics. Also make sure

the statistics

topic namespace is disjoint from the data topic namespace.

UDP transport options:

port=NUM receive on UDP port NUM

default is 2933

interface=IP receive multicast on interface IP default is INADDR_ANY (0.0.0.0) mcgroup=GRP receive on multicast group GRP

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

passthrough=VAL VAL may be 'off', 'on' or 'convert'

defaults to 'off'

PB format options:

passthrough=VAL VAL may be 'off', 'on' or 'convert'

defaults to 'off'

1.7.11 Example Ibmmon cmd.c

Example build:

```
gcc lbmmon_cmd.c -o lbmmon_cmd -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: lbmmon_cmd.c

```
Purpose: send unicast immediate control requests to an LBMMON publisher. Usage: lbmmon_cmd -T target_string -C command [options] Available options:
```

```
-c filename = Use LBM configuration file filename.  \qquad \qquad \text{Multiple config files are allowed.}
```

Example: '-c file1.cfg -c file2.cfg'

-C command = command to send [required]

-d = dump default filter options to stdout

-D data = data for command (either -D or -F, not both)

Example: '-C SET_INTERVAL -D 30'

1.7.12 Example Ibmmoncache.c

Example build:

```
gcc lbmmoncache.c -o lbmmoncache -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: lbmmoncache.c

```
Purpose: example LBM statistics monitoring application.
Usage: lbmmoncache [options]
Available options:
  -c, --config=FILE
                            Use LBM configuration file FILE.
                            Multiple config files are allowed.
                            Example: '-c file1.cfg -c file2.cfg'
 -C, --cache-size=size
                            Set the cache size to 'size' entries
  -h, --help
                            display this help and exit
  -t, --transport=TRANS
                            use transport module TRANS
                            TRANS may be 'lbm', 'udp', or 'lbmsnmp', default is
                                `lbm'
      --transport-opts=OPTS use OPTS as transport module options
                   use format module FMT
  -f, --format=FMT
                            FMT may be 'csv'
                            use OPTS as format module options
      --format-opts=OPTS
```

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

```
LBM transport options:
```

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

defaults to 'off'

PB format options:

passthrough=VAL VAL may be 'off', 'on' or 'convert'

defaults to 'off'

1.7.13 Example Ibmmondata.c

Example build:

```
gcc lbmmondata.c -o lbmmondata -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: lbmmondata.c

```
Purpose: example LBM statistics monitoring application.

Usage: lbmmondata [-c filename] [-t topicname]

-c filename = Use LBM configuration file filename.

Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg'

-t topicname = use topic topicname to receive statistics
```

1.7.14 Example Ibmmonudp.c

Example build:

```
gcc lbmmonudp.c -o lbmmonudp -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
```

Source code: lbmmonudp.c

Purpose: application that receives LBM statistics and forwards as CSV over UDP.

Usage: lbmmonudp [options]

Available options:

-a, --address=IP

-b, --broadcast=IP

-3, --force-32bit force all data values to fit within 32 bits

default is to use native data size applies only to 64-bit platforms send CSV data to unicast address IP send CSV data to broadcast address IP

-f, --format=FMT use monitor format module FMT

FMT may be 'csv'

--format-opts=OPTS use OPTS as format module options

-h, --help display this help and exit
-i, --interface=IP send multicast via interface IP
-m, --multicast=GRP send CSV data to multicast group GRP

-p, --port=NUM send CSV data on UDP port NUM

default is port 1234

-t, --transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm' or 'udp', default is 'lbm'

--transport-opts=OPTS use OPTS as transport module options

-T, --ttl=NUM send multicast with TTL NUM

default is 1

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC receive statistics on topic TOPIC default is /29west/statistics

wctopic=PATTERN receive statistics on wildcard topic PATTERN

See https://communities.informatica.com/infakb/faq/5/Pages/

80075.aspx

for guidelines on using wildcard topics. Also make sure

the statistics

topic namespace is disjoint from the data topic namespace.

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC receive statistics on topic TOPIC default is /29west/statistics

wctopic=PATTERN receive statistics on wildcard topic PATTERN

See https://communities.informatica.com/infakb/faq/5/Pages/

80075.aspx

for guidelines on using wildcard topics. Also make sure

the statistics

topic namespace is disjoint from the data topic namespace.

UDP transport options:

mcgroup=GRP

port=NUM receive on UDP port NUM

default is 2933

interface=IP receive multicast on interface IP

default is INADDR_ANY (0.0.0.0) receive on multicast group GRP

```
CSV format options:

separator=CHAR

defaults to ','

Don't use a semicolon!

VAL may be 'off', 'on' or 'convert'

defaults to 'off'

PB format options:

passthrough=VAL

VAL may be 'off', 'on' or 'convert'

defaults to 'off'
```

1.7.15 Example Ibmmrcv.c

Example build:

Usage: lbmmrcv [options] -B, --bufsize=# Set receive socket buffer size to # (in MB) Use LBM configuration file FILE. -c, --config=FILE Multiple config files are allowed. Example: '-c file1.cfg -c file2.cfg' -C, --contexts=NUM use NUM lbm_context_t objects -E, --exit exit and end upon receiving End-of-Stream notification -e, --end-flag=FILE $\,\,\,\,\,\,\,\,$ clean up and exit when file FILE is created -h, --help display this help and exit -i, --initial-topic=NUM use NUM as initial topic number -o, --regid-offset=offset use offset to calculate Registration ID (as source registration ID + offset) offset of 0 forces creation of regid by store -L, --linger=NUM linger for NUM seconds after done -r, --root=STRING use topic names with root of STRING -R, --receivers=NUM create NUM receivers -s, --statistics print statistics along with bandwidth -v, --verbose be verbose -V, --verify verify message contents

Monitoring options: --monitor-rcv=NUM

```
--monitor-ctx=NUM monitor context every NUM seconds
--monitor-transport=TRANS use monitor transport module TRANS
TRANS may be 'lbm', 'lbmsnmp', or 'udp', default
is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options
use monitor format module FMT
FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options
--monitor-appid=ID use ID as application ID string
```

monitor receiver every NUM seconds

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

```
LBM transport options:
```

Note that individual LBM options can be specified as $\langle scope \rangle | \langle option \rangle = value$, where

<scope> is one of context, source, receiver, wildcard_receiver, or event_queue

 $\langle {\it option} \rangle$ is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.16 Example Ibmmrcvq.c

Example build:

gcc lbmmrcvq.c -o lbmmrcvq -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/lib -lpthread
 -llbm -lm -lrsock -lprotobuf-c

Source code: lbmmrcvq.c

Purpose: application that receives messages from a set of one or more topics using event queues.

Usage: lbmmrcvq [options]

-B, --bufsize=# Set receive socket buffer size to # (in MB)

-c, --config=FILE Use LBM configuration file FILE.

Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg'

-C, --contexts=NUM use NUM lbm_context_t objects
-h, --help display this help and exit

-i, --initial-topic=NUM use NUM as initial topic number
-L, --linger=NUM linger for NUM seconds after done
-r, --root=STRING use topic names with root of STRING

-R, --receivers=NUM create NUM receivers

-v, --verbose be verbose

Monitoring options:

--monitor-rcv=NUM monitor receiver every NUM seconds --monitor-ctx=NUM monitor context every NUM seconds use monitor transport module TRANS

--monitor-transport=TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string --monitor-evq=NUM monitor event queue every NUM seconds

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

allow_debug=VAL VAL may be 'off' or 'on'

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ++1=NIJMsend multicast statistics with TTL NUM

default is 16

CSV format options:

separate CSV fields with character CHAR separator=CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.17 Example Ibmmreq.c

Example build:

```
gcc lbmmreq.c -o lbmmreq -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
Source code: lbmmreq.c
Purpose: application that sends request messages to a single topic
    and processes responses.
Usage: lbmmreq [options] topic
Available options:
  -c filename = Use LBM configuration file filename.
                Multiple config files are allowed.
                Example: '-c file1.cfg -c file2.cfg topicname'
  -d delay = delay sending for delay seconds after source creation
  -h = help
  -1 len = send messages of len bytes
  -r rate/pct = send with LBT-RM at rate and retransmission pct%
  -R requests = send requests number of requests
  -v = be verbose (-v - v = be even more verbose)
1.7.18 Example Ibmmsrc.c
Example build:
gcc lbmmsrc.c verifymsg.c -o lbmmsrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmmsrc.c
Purpose: send messages on multiple topics, optionally by multiple threads.
    Topic names generated as a root, a dot, and by an integer.
    By default, the first topic created will be ^\prime 29 \text{west.example.multi.0}^\prime
Usage: lbmmsrc [options]
Available options:
  -b, --batch=NUM
                             send messages in batch sizes of NUM between each pause
  -c, --config=FILE
                             Use LBM configuration file FILE.
                             Multiple config files are allowed.
                             Example: '-c file1.cfg -c file2.cfg'
  -d, --delay=NUM
                             delay sending for delay seconds after source creation
  -h, --help
                             display this help and exit
  -i, --initial-topic=NUM
                            use NUM as initial topic number [0]
  -j, --late-join=NUM
                            enable Late Join with specified retention buffer size
     (in bytes)
  -1, --length=NUM
                            send messages of length NUM bytes
  -L, --linger=NUM
                            linger for NUM seconds after done
  -M, --messages=NUM
                            send maximum of NUM messages
  -P, --pause=NUM
                            pause NUM milliseconds after each send
  -r, --root=STRING
                            use topic names with root of STRING
     [29west.example.multi]
  -R, --rate=[UM]DATA/RETR Set transport type to LBT-R[UM], set data rate limit to
                             DATA bits per second, and set retransmit rate limit to
                             RETR bits per second. For both limits, the optional
                             k, m, and g suffixes may be used. For example,
                             ^{\prime}\,\text{-R} 1m/500k' is the same as ^{\prime}\,\text{-R} 1000000/500000'
                            print stats every NUM seconds
  -s, --statistics=NUM
                            use NUM sources
  -S, --sources=NUM
  -T, --threads=NUM
                            use NUM threads
```

be verbose

construct verifiable messages

-v, --verbose

-V, --verifiable_msg

Monitoring options:

--monitor-src=NUM monitor source every NUM seconds
--monitor-ctx=NUM monitor context every NUM seconds
--monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

 $\verb"port=NUM" send to UDP port NUM"$

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.19 Example Ibmpong.c

Example build:

gcc lbmpong.c -o lbmpong -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/lib -lpthread
 -llbm -lm -lrsock -lprotobuf-c

```
Source code: lbmpong.c
Purpose: application that measures round trip message latency.
Usage: lbmpong [-ChIqRv] [-c filename] [-i msgs] [-l len] [-M msgs] [-P msec] [-r
    rate/pct] [-s seed] [-t secs] [-T topic] id
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -C = collect RTT data
       -h = help
       -\mathrm{i} msgs = send and ignore msgs messages to warm up
       -o offset = use offset to calculate Registration ID
                   (as source registration ID + offset)
                   offset of 0 forces creation of regid by store
       -I = Use MIM
       -1 len = use len length messages
       -M msgs = stop after receiving msgs messages
       -P msec = pause after each send msec milliseconds
       -q = use an LBM event queue
       -r [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                          DATA bits per second, and set retransmit rate limit to
                          RETR bits per second. For both limits, the optional
                          k, m, and g suffixes may be used. For example,
                          '-r 1m/500k' is the same as '-r 1000000/500000'
       -R = perform RTT measurement per message
       -s seed = init randomization of contents of message payload
       -t secs = run for secs seconds
       -T topic = topic name prefix (appended with '/' and id) [lbmpong]
       -v = be verbose about each message
       id = either 'ping' or 'pong'
1.7.20 Example Ibmprice.c
Example build:
gcc lbmprice.c -o lbmprice -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c -llbmsdm -llbmutl
Source code: lbmprice.c
Purpose: simulated price source and receiver for demonstration.
Usage: lbmprice -s [-h] [-c filename]
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -h = help
       -H = act has Hot Failover relay for a price source
       -1 pct = induce random receiver loss of pct percent
       -n ms = set receiver NAK generation interval to ms milliseconds
       -s = act as a price source (acts as a receiver by default)
       -t ttl = set resolver (and multicast source) ttl to ttl
       -v = be verbose
Alternate usage: lbmprice [-h] [-c filename]
       -c filename = read config file
       -h = help
```

-1 pct = induce random receiver loss of pct percent, print max latency

-n ms = set receiver NAK generation interval to ms milliseconds

-H = use Hot Failover receiver

```
-o mode = set ordered delivery mode (1=ordered, 0=arrival order) -t ttl = set resolver (and multicast source) ttl to ttl -v = be verbose
```

1.7.21 Example Ibmrcv.c

Example build:

```
gcc lbmrcv.c verifymsg.c -o lbmrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmrcv.c
Purpose: application that receives messages from a given topic.
Usage: lbmrcv [-ACEfhqsSvV] [-c filename] [-r msqs] [-U losslev] topic
Available options:
  -A, --ascii
                       display messages as ASCII text (-A -A = newlines after each
     msg)
  -c, --config=FILE Use LBM configuration file FILE.
                       Multiple config files are allowed.
                       Example: '-c file1.cfg -c file2.cfg'
  -C, --context-stats fetch context rather than receiver stats
 -E, --exit exit when source beg.
-f, --failover use a hot-failover receiver
                      exit when source stops sending
  -q, --eventq use an LBM event queue exit after NUM messages
  -O, --orderchecks
                       Enable message order checking
  -N, --channel=NUM subscribe to channel NUM
 -s, --stats=NUM print LBM statistics every NUM seconds allow up to NUM sources (for statistics gathering purposes)
                      exit when source stops sending, and print throughput summary
  -S, --stop
  -U, --losslev=NUM
                       exit after NUM% unrecoverable loss
  -v, --verbose
                      be verbose about incoming messages (-v -v = be even more
     verbose)
  -V, --verify
                       verify message contents
Monitoring options:
  --monitor-rcv=NUM
                                 monitor receiver every NUM seconds
  --monitor-ctx=NUM
                                 monitor context every NUM seconds
                                  use monitor transport module TRANS
  --monitor-transport=TRANS
                                 TRANS may be 'lbm', 'lbmsnmp', or 'udp', default
                                     is 'lbm'
  --monitor-transport-opts=OPTS use OPTS as transport module options
  --monitor-format=FMT
                                 use monitor format module FMT
                                 FMT may be 'csv' or 'pb'
  --monitor-format-opts=OPTS
                                use OPTS as format module options
  --monitor-appid=ID
                                 use ID as application ID string
Transport and format options are passed as name=value pairs, separated by a
   semicolon.
The entire option string should be enclosed in double-quotes.
```

```
LBM transport options:
```

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options. config=FILE use LBM configuration file FILE

topic=TOPIC send statistics on topic TOPIC

default is /29west/statistics

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

 $\verb"port=NUM" send to UDP port NUM"$

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.22 Example Ibmrcvq.c

Example build:

Source code: lbmrcvq.c

Purpose: application that receives messages from a given topic using an event queue.

Usage: lbmrcvq [options] topic

Available options:

-c, --config=FILE Use LBM configuration file FILE.

-C, --context-stats fetch context rather than receiver stats Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg' exit after source ends

-E, --exit exit after source ends -h, --help display this help and exit

-r NUM delete receiver after NUM messages -s, --stats=NUM print LBM statistics every NUM seconds

-S, --stop exit after source ends, print throughput summary

-v, --verbose be verbose about incoming messages (-v -v = be even more

verbose)

Monitoring options:

--monitor-rcv=NUM monitor receiver every NUM seconds

--monitor-ctx=NUM monitor context every NUM seconds --monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS $\,$ use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options
--monitor-appid=ID use ID as application ID string
--monitor-evq=NUM monitor event queue every NUM seconds

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

allow_debug=VAL VAL may be 'off' or 'on'

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.23 Example Ibmrcvxsp.c

Example build:

gcc lbmrcvxsp.c verifymsg.c -o lbmrcvxsp -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/
 lib -lpthread -llbm -lm -lrsock -lprotobuf-c

```
Purpose: application that receives messages from a given topic, mapping transports
   to various XSPs.
Usage: lbmrcv [-ACdDEhPrRsSv] [-c filename] [-r msgs] topic
Available options:
  -A, --ascii
                                  display messages as ASCII text (-A - A = newlines)
     after each msg)
  -c, --config=FILE
                                  Use LBM configuration file FILE.
                                  Multiple config files are allowed.
                                 Example: '-c file1.cfg -c file2.cfg'
 -C, --context-stats
                                 fetch context rather than receiver stats
  -d, --defer-xsp-deletion
                                 don't delete xsps until shutdown
  -D, --default-xsp
                                 use the default XSP for all transports
  -E, --exit
                                  exit when source stops sending
  -h, --help
                                 display this help and exit
  -P, --round-robin-preallocate
                                 preallocate the XSPs - use with -R
  -Q, --sequential-xsps
                                 use sequential mode for XSPs
  -r, --msgs=NUM
                                  exit after NUM messages
 -R, --round-robin=NUM
                                  use a simple round-robin method for assigning
     transports to NUM XSPs.
                                  (this is the DEFAULT for this application, with a
                                     NUM of 3
  -s, --stats=NUM
                                  print LBM statistics every NUM seconds
```

verify message contents

exit when source stops sending, and print

be verbose about incoming messages (-v - v = be

1.7.24 Example Ibmreq.c

throughput summary

even more verbose)

Source code: lbmrcvxsp.c

Example build:

-S, --stop

-v, --verbose

-V, --verify

```
gcc lbmreq.c -o lbmreq -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm
   -lm -lrsock -lprotobuf-c
Source code: lbmreq.c
Purpose: application that sends requests on a single topic and waits for
   responses.
Usage: lbmreq [options] topic
Available options:
  -c filename = Use LBM configuration file filename.
               Multiple config files are allowed.
               Example: '-c file1.cfg -c file2.cfg'
  -d sec = delay sending for delay seconds after source creation
  -h = help
  -1 len = send messages of len bytes
  -L linger = linger for linger seconds before closing context
 -P sec = pause sec seconds after sending request for responses to arrive
  -r [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                     DATA bits per second, and set retransmit rate limit to
                     RETR bits per second. For both limits, the optional
                     k, m, and g suffixes may be used. For example,
                     '-r 1m/500k' is the same as '-r 1000000/500000'
  -R requests = send requests number of requests
  -q = Use Event Queue
  -v = be verbose (-v - v = be even more verbose)
```

1.7.25 Example Ibmresp.c

Example build:

```
gcc lbmresp.c -o lbmresp -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: lbmresp.c
Purpose: application that receives request messages on a single topic and
    and sends responses back
Usage: lbmresp [-Ehsv] [-c filename] [-l len] [-r responses] [-f topic] topic
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -E = end after end-of-stream
       -h = help
       -1 len = use len bytes for the length of each response
       -r responses = send responses messages for each request
       -s = be silent about incoming messages
       -v = be verbose (-v - v = be even more verbose)
       -f = forward request to responders listening on given topic
```

1.7.26 Example Ibmresping.c

Example build:

1.7.27 Example Ibmrespq.c

-h = help

Example build:

```
gcc lbmrespq.c -o lbmrespq -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
```

Source code: lbmrespq.c

1.7.28 Example Ibmspike.c

Example build:

```
gcc lbmspike.c -o lbmspike -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
Source code: lbmspike.c
Purpose: application that generates & receives message spikes for
    performance testing.
Usage: lbmspike -R [-dhq] [-c filename] [-o ord] [-u bufsiz] [topic]
       -c filename = Use LBM configuration file filename.
                     Multiple config files are allowed.
                     Example: '-c file1.cfg -c file2.cfg'
       -d = dump message time stamps to a file
       -h = help
       -o ord = set receiver ordered delivery to ord
       -q = processess received messages on an event queue
       -R = role is receiver (default role is source)
       -u bufsiz = UDP buffer size for LBT-RM
Alternate usage: lbmspike [-dhLn] [-B bghumms] [-c filename] [-l len] [-M msgs] [-r
    rate/pct] [-v recovms] [topic]
       -B bghumms = milliseconds between "background hum" messages
       -c filename = read config file filename
       -d = dump message time stamps to a file
       -h = help
       -1 len = use len length messages
       -L = use TCP-LB
       -M msgs = stop after receiving msgs messages
       -n = use non-blocking writes
       -r [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                          DATA bits per second, and set retransmit rate limit to
                          RETR bits per second. For both limits, the optional
                          k, m, and g suffixes may be used. For example,
                          '-r 1m/500k' is the same as '-r 1000000/500000'
       -v recovms = milliseconds after spike to allow for recovery
```

1.7.29 Example Ibmsrc.c

Example build:

Source code: lbmsrc.c

Purpose: application that sends to a single topic as fast possible.

Usage: lbmsrc [options] topic

Available options:

-c, --config=FILE Use LBM configuration file FILE.

Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg'

-d, --delay=NUM delay sending for NUM seconds after source creation

-h, --help display this help and exit

-j, --late-join=NUM enable Late Join with specified retention buffer size

(in bytes)

-1, --length=NUM send messages of NUM bytes

-L, --linger=NUM linger for NUM seconds before closing context

-M, --messages=NUM send NUM messages
-n, --non-block use non-blocking I/O
-N, --channel=NUM send on channel NUM

-P, --pause=NUM pause NUM milliseconds after each send

-R, --rate=[UM]DATA/RETR Set transport type to LBT-R[UM], set data rate limit to

DATA bits per second, and set retransmit rate limit to RETR bits per second. For both limits, the optional k, m, and g suffixes may be used. For example, '-R 1m/500k' is the same as '-R 1000000/500000'

-s, --statistics=NUM print statistics every NUM seconds
-v, --verbose be verbose about each message
-V, --verifiable construct verifiable messages

Monitoring options:

--monitor-src=NUM monitor source every NUM seconds
--monitor-ctx=NUM monitor context every NUM seconds
--monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS $\,$ use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC

default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.30 Example lbmssrc.c

Example build:

gcc lbmssrc.c verifymsg.c -o lbmssrc -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c

Source code: lbmssrc.c

Purpose: application that uses Smart Source to send to a single topic. Usage: lbmssrc [options] topic

Available options:

-a, --available-data-space print the length of available data space -b, --user-supplied-buffer send messages using a user-supplied buffer

-c, --config=FILE Use LBM configuration file FILE.

Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg'

-d, --delay=NUM delay sending for NUM seconds after source creation

-h, --help display this help and exit

-i, --int-mprop=VAL,KEY send integer message property value VAL with name KEY -j, --late-join=NUM enable Late Join with specified retention buffer count

-1, --length=NUM send messages of NUM bytes

NOTE: set LBM_SMART_SOURCE_CHECK=0xffffffff env

variable

to check if the maximum message length is

exceeded

-L, --linger=NUM linger for NUM seconds before closing context

-M, --messages=NUM send NUM messages -N, --channel=NUM send on channel NUM

-S, --perf-stats=NUM,OT print performance stats every NUM messages sent

If optional OT is given, override the default 10 usec

Outlier Threshold

-P, --pause=NUM pause NUM milliseconds after each send -s, --statistics=NUM print statistics every NUM seconds -v, --verbose be verbose; add per message data -V, --verifiable construct verifiable messages

Monitoring options:

--monitor-src=NUM monitor source every NUM seconds --monitor-ctx=NUM monitor context every NUM seconds

--monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

allow_debug=VAL VAL may be 'off' or 'on'

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.31 Example Ibmssrcreq.c

Example build:

gcc lbmssrcreq.c -o lbmssrcreq -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/lib
 -lpthread -llbm -lm -lrsock -lprotobuf-c

Source code: lbmssrcreq.c

```
Purpose: application that sends requests on a single topic and waits for
    responses.
Usage: lbmssrcreq [options] topic
Available options:
  -a, --available-data-space print the length of available data space -b, --user-supplied-buffer send messages using a user-supplied buffer
  -c filename = Use LBM configuration file filename.
                Multiple config files are allowed.
                Example: '-c file1.cfg -c file2.cfg'
  -d sec = delay sending for delay seconds after source creation
  -h = help
  -1 len = send messages of len bytes
  -L linger = linger for linger seconds before closing context
  -P sec = pause sec seconds after sending request for responses to arrive
  -r [UM]DATA/RETR = Set transport type to LBT-R[UM], set data rate limit to
                     DATA bits per second, and set retransmit rate limit to
                     RETR bits per second. For both limits, the optional
                     k, m, and g suffixes may be used. For example,
                     '-r 1m/500k' is the same as '-r 1000000/500000'
  -R requests = send requests number of requests
  -v = be verbose (-v - v = be even more verbose)
1.7.32 Example lbmstrm.c
Example build:
gcc lbmstrm.c verifymsg.c -o lbmstrm -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmstrm.c
Purpose: application that sends messages to one or more topics at a
    specified rate.
Usage: lbmstrm [options]
  Topic names generated as a root, followed by a dot, followed by an integer.
  By default, the first topic created will be '29west.example.multi.0'
Available options:
  -c, --config=FILE
                             Use LBM configuration file FILE.
                             Multiple config files are allowed.
                             Example: '-c file1.cfg -c file2.cfg'
  -h, --help
                             display this help and exit
  -H, --hf
                             Use hot failover sources
  -i, --initial-topic=NUM use NUM as initial topic number [0]
  -j, --late-join=NUM
                            enable Late Join with specified retention buffer size
     (in bytes)
  -1, --length=NUM
                            send messages of length NUM bytes [25]
  -L, --linger=NUM
                            linger for NUM seconds after done [10]
  -m, --message-rate=NUM
                          send at NUM messages per second [10000]
  -M, --messages=NUM
                            send maximum of NUM messages [10000000]
  -r, --root=STRING
                            use topic names with root of STRING
      [29west.example.multi]
  -R, --rate=[UM]DATA/RETR Set transport type to LBT-R[UM], set data rate limit to
                             DATA bits per second, and set retransmit rate limit to
                             RETR bits per second. For both limits, the optional
                             k, m, and g suffixes may be used. For example,
```

'-R 1m/500k' is the same as '-R 1000000/5000000'

tight loop (cpu-bound) for even message spacing

print stats every NUM seconds

use NUM sources [100]

-s, --statistics=NUM

-S, --sources=NUM

-t, --tight

```
-T, --threads=NUM use NUM threads [1]
-x, --bits=NUM use NUM bits for hot failover sequence number size (32 or 64)
```

1.7.33 Example Ibmtrreq.c

Example build:

```
gcc lbmtrreq.c verifymsg.c -o lbmtrreq -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
   -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: lbmtrreq.c
Purpose: application that invokes the Topic Resolution Request API.
Usage: lbmtrreq [options]
Available options:
  -c, --config=FILE
                         Use LBM configuration file FILE.
                         Multiple config files are allowed.
                        Example: '-c file1.cfg -c file2.cfg'
                        Request Advertisements
  -a, --adverts
  -q, --queries
                        Request Queries
  -w, --wildcard
                       Request Wildcard Queries
  -A, --ctx-ads
                       Request Context Advertisements
  -Q, --ctx-queries Request Context Queries
-I, --gw-interest Request Gateway Interest
  -i, --interval=NUM Interval between request
  -d, --duration=NUM Minimum duration of requests
```

Linger for NUM seconds before closing context

1.7.34 Example Ibmwrcv.c

-L, --linger=NUM

Example build:

```
gcc lbmwrcv.c -o lbmwrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: lbmwrcv.c
Purpose: application that receives messages from a wildcard receiver.
Usage: lbmwrcv [options] pattern
Available options:
  -c, --config=FILE
                       Use LBM configuration file FILE.
                       Multiple config files are allowed.
                       Example: '-c file1.cfg -c file2.cfg'
 -D, --deregister
                       Send Deregistration after receiving 1000 messages
 -E, --exit
                       exit after source ends
  -h, --help
                       display this help and exit
                       Use event queue
  -q
  -r NUM
                       delete receiver after NUM messages
  -N, --channel=NUM subscribe to channel NUM
  -s, --statistics print statistics along with bandwidth
                       be verbose about incoming messages (-v -v = be even more
  -v, --verbose
     verbose)
```

Monitoring options:

--monitor-ctx=NUM monitor context every NUM seconds --monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

 $\verb"port=NUM" send to UDP port NUM"$

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

1.7.35 Example Ibmwrcvq.c

Example build:

gcc lbmwrcvq.c -o lbmwrcvq -I\$LBM/include -I\$LBM/include/lbm -L\$LBM/lib -lpthread
 -llbm -lm -lrsock -lprotobuf-c

Source code: lbmwrcvq.c

Purpose: application that receives messages from a wildcard receiver, using an event queue.

Usage: lbmwrcvq [options] pattern

Available options:

-c, --config=FILE Use LBM configuration file FILE.

Multiple config files are allowed.

Example: '-c file1.cfg -c file2.cfg'

-E, --exit exit after source ends -h, --help display this help and exit

-r NUM delete receiver after NUM messages -s, --statistics print statistics along with bandwidth

-v, --verbose be verbose about incoming messages (-v -v = be even more

verbose)

Monitoring options:

--monitor-ctx=NUM monitor context every NUM seconds --monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options
--monitor-appid=ID use ID as application ID string
--monitor-evq=NUM monitor event queue every NUM seconds

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options: filters=FILE

use FILE that contains filter options

1.7.36 Example minrcv.c

Example build:

```
gcc minrcv.c -o minrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: minrcv.c

minrcv.c: minimal application that receives messages from a given topic.

1.7.37 Example minrcv.cpp

Example build:

Source code: minrcv.cpp

minimal C++ application that receives messages from a given topic.

1.7.38 Example minsrc.c

Example build:

```
gcc minsrc.c -o minsrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm
-lm -lrsock -lprotobuf-c
```

Source code: minsrc.c

minsrc.c: minimal application that sends to a given topic.

1.7.39 Example srs_cmd.c

Example build:

```
gcc srs_cmd.c srs_cmd_msg.c -o srs_cmd -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: srs_cmd.c

```
Purpose: send unicast immediate command messages to an SRS daemon.
Usage: srs_cmd [options] [command_string]
Available options:
 -c filename = Use LBM configuration file filename.
              Multiple config files are allowed.
              Example: '-c file1.cfg -c file2.cfg'
 -h = help
 -L linger = linger for linger seconds before closing context
 -T target = target for unicast immediate messages (required)
*******************
       help (print this message): h
         quit (exit application): q
             report SRS version: version
* set category publishing interval: srs_stats 0 | 200-N
                               um_client_stats 0 | 200-N
                               connection_events 0 | 200-N
                                srs_error_stats 0 | 200-N
                                um_client_error_stats 0 | 200-N
                                config_opts 0 | 200-N
                                internal_config_opts 0 | 200-N
    set all publishing intervals: interval 0 | 200-N
               snapshot category: snap srs_stats | um_client_stats |
                                connection_events | srs_error_stats |
                                um_client_error_stats | config_opts |
                                internal_config_opts
         snapshot all categories: snap
************************
```

1.7.40 Example srs_monitor_info_receiver.c

Example build:

```
qcc srs_monitor_info_receiver.c -o srs_monitor_info_receiver -I$LBM/include -I$LBM/
    include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: srs_monitor_info_receiver.c
Purpose: receive SRS monitor info messages on the specified topic.
 Note: this tool is deprecated.
  See https://ultramessaging.github.io/currdoc/doc/ChangeLog/
     deprecations.html#deprecationsfor615
Usage: srs_monitor_info_receiver [options] topic
Available options:
  -c, --config=FILE
                       Use LBM configuration file filename.
                      Multiple config files are allowed.
                      Example: '-c file1.cfg -c file2.cfg'
  -E, --exit
                      exit upon EOS reception
  -h, --help
                      help
  -L, --linger
                      linger for linger seconds before closing context
```

1.7.41 Example tnwgdcmd.c

```
gcc tnwgdcmd.c -o tnwgdcmd -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
   -llbm -lm -lrsock -lprotobuf-c
Source code: tnwgdcmd.c
Purpose: application sends unicast immediate command messages to a tnwgd publishing
Usage: tnwqdcmd -T target_string -c config_file [command_string]
Available options:
 -c filename = Use LBM configuration file filename.
              Multiple config files are allowed.
              Example: '-c file1.cfg -c file2.cfg'
 -h = help
 -L linger = linger for linger seconds before closing context
 -T target = target for unicast immediate messages (mandatory)
*******************
* help (print this message): h
  quit (exit application): q
   set publishing interval: (0-N = interval in seconds)
                         ri 0-N (routing info)
                         gcfg 0-N
                                    (gateway config)
         mallinfo 0-N (malloc info)
   snapshot all groups (and all portals) : snap
   snapshot single group: snap (ri|gcfg|pcfg|pstat|mallinfo)
   snapshot single portal: "portal name" snap pcfg|pstat
   Print the current version of the monitor: version
```

1.7.42 Example tnwgdmon.c

```
gcc tnwgdmon.c -o tnwgdmon -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
Source code: tnwgdmon.c
```

1.7.43 Example ume-example-rcv-2.c

Example build:

```
gcc ume-example-rcv-2.c -o ume-example-rcv-2 -I$LBM/include -I$LBM/include/lbm
    -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: ume-example-rcv-2.c
ume-example-rcv-2.c: - Persistent example receiver program.
See Persistence Guide document.
```

1.7.44 Example ume-example-rcv-3.c

Example build:

```
gcc ume-example-rcv-3.c -o ume-example-rcv-3 -I$LBM/include -I$LBM/include/lbm
    -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: ume-example-rcv-3.c
ume-example-rcv-3.c: - Persistent example receiver program.
See Persistence Guide document.
```

1.7.45 Example ume-example-rcv.c

Example build:

```
gcc ume-example-rcv.c -o ume-example-rcv -I$LBM/include -I$LBM/include/lbm -L$LBM/
    lib -lpthread -llbm -lm -lrsock -lprotobuf-c

Source code: ume-example-rcv.c

ume-example-rcv.c: - Persistent example receiver program.
See Persistence Guide document.
```

1.7.46 Example ume-example-src-2.c

```
gcc ume-example-src-2.c -o ume-example-src-2 -I$LBM/include -I$LBM/include/lbm
    -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c

Source code: ume-example-src-2.c

ume-example-src-2.c: - Persistent example source program.
See Persistence Guide document.
```

1.7.47 Example ume-example-src-3.c

Example build:

```
gcc ume-example-src-3.c -o ume-example-src-3 -I$LBM/include -I$LBM/include/lbm
-L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: ume-example-src-3.c

ume-example-src-3.c: - Persistent example source program. See Persistence Guide document.

1.7.48 Example ume-example-src.c

Example build:

```
gcc ume-example-src.c -o ume-example-src -I$LBM/include -I$LBM/include/lbm -L$LBM/
    lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

```
Source code: ume-example-src.c
```

ume-example-src.c: - Persistent example receiver program.
See Persistence Guide document.

1.7.49 Example umedcmd.c

Example build:

```
gcc umedcmd.c -o umedcmd -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
```

Source code: umedcmd.c See umedcmd Man Page for usage information.

1.7.50 Example umedmon.c

```
gcc umedmon.c -o umedmon -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread
    -llbm -lm -lrsock -lprotobuf-c
```

```
Source code: umedmon.c
```

```
Example: '-c file1.cfg -c file2.cfg'
-E, --exit
                     exit when source stops sending
-h, --help
                     display this help and exit
-v, --verbose
                     be verbose about incoming messages (-v - v = be even more
   verbose)
```

1.7.51 Example umercv.c

Example build:

```
qcc umercv.c verifymsq.c -o umercv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
   -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: umercv.c
```

Purpose: application that receives persisted messages from a given topic. Usage: umercv [options] topic Available options:

```
-A, --ascii
                           display messages as ASCII text (-A -A for newlines
   after each msg)
                           Use LBM configuration file FILE.
-c, --config=FILE
                           Multiple config files are allowed.
                           Example: '-c file1.cfg -c file2.cfg'
-D, --deregister=NUM
                           Deregister the receiver after receiving NUM messages
-E, --exit
                           exit after source ends
-e, --explicit-ack=N
                          send an Explicit ACK every N messages
-h, --help
                          display this help and exit
                          allow num sources (for statistics gathering purposes)
--max-sources=num
-i, --regid-offset=offset use offset to calculate Registration ID
                           (as source registration ID + offset)
                           offset of 0 forces creation of regid by store
                           display recovery sequence number info and set low
-N, --segnum=X
   segnum to low+X
-r, --msqs=NUM
                           delete receiver after NUM messages
    --session-id=NUM
                           Use NUM as a Session ID rather than using a
       Registration ID
                           (regid-offset will be ignored)
-s, --statistics=NUM
                           print statistics every NUM seconds, along with
   bandwidth
-S, --stop
                           exit after source ends, print throughput summary
-u, --uregid=num
                           set User settable Registration ID to num for context
-v, --verbose
                           be verbose about incoming messages
```

(-v - v = be even more verbose)

verify message contents -x, --no-exit-on-reg-error don't exit on registration error (default is to exit)

1.7.52 Example umesnaprepo.c

Example build:

-V, --verify

```
gcc umesnaprepo.c -o umesnaprepo -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
   -lpthread -llbm -lm -lrsock -lprotobuf-c -llbmutl -lumestorelib -lrt
   -lsmartheap_smp64
```

Source code: umesnaprepo.c See umesnaprepo Man Page for usage information.

1.7.53 Example umesrc.c

Example build:

```
gcc umesrc.c verifymsg.c -o umesrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
   -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: umesrc.c
Purpose: application that sends persisted messages to a given topic at a
   specified rate.
Usage: umesrc [options] topic
Available options:
  -c, --config=FILE
                           Use LBM configuration file FILE.
                           Multiple config files are allowed.
                           Example: '-c file1.cfg -c file2.cfg'
  -d, --delay=NUM
                           delay sending for NUM seconds after source creation
  -D, --deregister
                           deregister the source after sending messages
  -h, --help
                         display this help and exit
                           turn on UME late join
  -j, --late-join
  -f, --flight-size=NUM
                           allow NUM unstabilized messages in flight (determines
     message rate)
  -1, --length=NUM
                           send messages of NUM bytes
  -L, --linger=NUM
                           linger for NUM seconds before closing context
  -M, --messages=NUM
                           send NUM messages
  -m, --message-rate=NUM
                           send at NUM messages per second if allowed by the
     flight size setting
  -N, --seqnum-info
                           display sequence number information from source events
  -n, --non-block
                           use non-blocking I/O
  -P, --pause=NUM
                           pause NUM milliseconds after each send
  -R, --rate=[UM]DATA/RETR Set transport type to LBT-R[UM], set data rate limit to
                           DATA bits per second, and set retransmit rate limit to
                           RETR bits per second. For both limits, the optional
                           k, m, and g suffixes may be used. For example,
                           '-R 1m/500k' is the same as '-R 1000000/500000'
  -s, --statistics=NUM
                           print statistics every NUM seconds
  -S, --store=IP
                           use specified UME store
  -t, --storename=NAME
                          use specified UME store
  -v, --verbose
                          print additional info in verbose form
  -V, --verifiable
                           construct verifiable messages
```

1.7.54 Example umessrc.c

Example build:

```
gcc umessrc.c verifymsg.c -o umessrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: umessrc.c

Purpose: application that uses Smart Source sends to a given topic. Understands persistence.

Usage: umessrc [options] topic Available options: -a, --available-data-space print the length of available data space -b, --user-supplied-buffer send messages using a user-supplied buffer -c, --config=FILE Use LBM configuration file FILE. Multiple config files are allowed. Example: '-c file1.cfg -c file2.cfg' -d, --delay=NUM delay sending for NUM seconds after smart source creation deregister the smart source after sending messages -D, --deregister -h, --help display this help and exit -i, --int-mprop=VAL,KEY send integer message property value VAL with name KEY -j, --late-join turn on UME late join -f, --flight-size=NUM allow NUM unstabilized messages in flight (determines message rate) -1, --length=NUM send messages of NUM bytes -L, --linger=NUM linger for NUM seconds before closing context -M, --messages=NUM send NUM messages send at NUM messages per second if allowed by the -m, --message-rate=NUM flight size setting -N, --channel=NUM send on channel NUM -n, --non-block use non-blocking I/O -P, --pause=NUM pause NUM milliseconds after each send -Q, --seqnum-info display sequence number information from smart source events print statistics every NUM seconds -s, --statistics=NUM -S, --store=IP use specified UME store -t, --storename=NAME use specified UME store -v, --verbose print additional info in verbose form -V, --verifiable construct verifiable messages Monitoring options: --monitor-src=NUM monitor source every NUM seconds --monitor-ctx=NUM monitor context every NUM seconds --monitor-transport=TRANS use monitor transport module TRANS TRANS may be 'lbm', 'lbmsnmp', or 'udp', default is 'lbm' --monitor-transport-opts=OPTS use OPTS as transport module options --monitor-format=FMT use monitor format module FMT FMT may be 'csv' or 'pb' --monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics allow_debug=VAL VAL may be 'off' or 'on'

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

address=IP send statistics to address IP

port=NUM send to UDP port NUM

default is 2933

mcgroup=GRP send on multicast group GRP

bcaddress=IP send statistics to broadcast address IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separator=CHAR separate CSV fields with character CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.55 Example umestored example.c

Example build:

```
gcc umestored_example.c -o umestored_example -I$LBM/include -I$LBM/include/lbm
   -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c -llbmutl -lumestorelib -lrt
   -lsmartheap_smp64
```

Source code: umestored_example.c

umestored_example.c: application that shows how to call the umestored_main API to start a UMP store daemon.

1.7.56 Example umgrcv.c

Example build:

```
gcc umqrcv.c verifymsg.c -o umqrcv -I$LBM/include -I$LBM/include/lbm -L$LBM/lib -lpthread -llbm -lm -lrsock -lprotobuf-c
```

Source code: umgrcv.c

Purpose: application that receives brokered queuing messages from a single topic. Usage: umqrcv [options] topic

Available options:

```
-A, --ascii display messages as ASCII text (-A -A for newlines after each msg)
```

-B, --broker=address use broker given by address

-c, --config=FILE $\,\,$ use FILE as LBM configuration file

-D, --dereg deregister upon exit

-d, --delay=NUM delay receiver creation NUM seconds from context creation

-E, --exit exit after source ends -h, --help display this help and exit

-I, --type-id=ID set Receiver Type ID to ID

-1, --cype id ---max-sources=num allow num sources (for statistics gathering purposes)

-r, --msgs=NUM delete receiver after NUM messages

-s, --statistics=NUM print statistics every NUM seconds, along with bandwidth

-S, --stop exit after source ends, print throughput summary

-X, --index reserve given index if possible, or leave blank to reserve

random index

-v, --verbose be verbose about incoming messages

(-v - v = be even more verbose)

-V, --verify verify message contents

Monitoring options:

monitor receiver every NUM seconds --monitor-rcv=NUM --monitor-ctx=NUM monitor context every NUM seconds --monitor-transport=TRANS use monitor transport module TRANS

TRANS may be 'lbm', 'lbmsnmp', or 'udp', default

is 'lbm'

--monitor-transport-opts=OPTS use OPTS as transport module options

--monitor-format=FMT use monitor format module FMT

FMT may be 'csv' or 'pb'

--monitor-format-opts=OPTS use OPTS as format module options --monitor-appid=ID use ID as application ID string

Transport and format options are passed as name=value pairs, separated by a semicolon.

The entire option string should be enclosed in double-quotes.

LBM transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

allow_debug=VAL VAL may be 'off' or 'on'

defaults to 'off'

LBMSNMP transport options:

Note that individual LBM options can be specified as <scope>|<option>=value, where <scope> is one of context, source, receiver, wildcard_receiver, or event_queue <option> is the LBM configuration option name

The vertical bar (pipe symbol) is required when specifying individual LBM options.

config=FILE use LBM configuration file FILE topic=TOPIC send statistics on topic TOPIC default is /29west/statistics

UDP transport options:

send statistics to address IP address=TP

port=NUM send to UDP port NUM default is 2933

mcgroup=GRP send on multicast group GRP

send statistics to broadcast address IP bcaddress=IP ttl=NUM send multicast statistics with TTL NUM

default is 16

CSV format options:

separate CSV fields with character ${\tt CHAR}$ separator=CHAR

defaults to ','

Don't use a semicolon!

PB format options:

filters=FILE use FILE that contains filter options

1.7.57 Example umqsrc.c

Example build:

```
gcc umqsrc.c verifymsg.c -o umqsrc -I$LBM/include -I$LBM/include/lbm -L$LBM/lib
    -lpthread -llbm -lm -lrsock -lprotobuf-c
Source code: umqsrc.c
Purpose: umqsrc.c: application that sends brokered queuing messages to a single
    topic at a specified rate.
Usage: umqsrc [options] topic
Available options:
  -A, --appsets=CFG use ULB Application Sets given by CFG
-B, --broker=address use broker given by address
-c, --config=FILE use LBM configuration file FILE
-d, --delay=NUM delay sending for NUM seconds after source creation
-h, --help display this help and exit
  -f, --flight-size=NUM allow NUM unstabilized messages in flight (determines
      message rate)
  -i, --ids display Message IDs for sent message
-l, --length=NUM send messages of NUM bytes
-L, --linger=NUM linger for NUM seconds before closing context
-M, --messages=NUM send NUM messages
  -m, --message-rate=NUM send at NUM messages per second
  -N, --seq-num
                                display sequence number information
  -n, --non-block
                                 use non-blocking I/O
  -P, --pause=NUM
                                 pause NUM milliseconds after each send
  -R, --rate=[UM]DATA/RETR Set transport type to LBT-R[UM], set data rate limit to
                                 DATA bits per second, and set retransmit rate limit to
                                 RETR bits per second. For both limits, the optional
                                 k, m, and g suffixes may be used. For example,
                                 '-R 1m/500k' is the same as '-R 1000000/500000'
                                print statistics every NUM seconds
  -s, --statistics=NUM
  -v, --verbose
                                print additional info in verbose form
  -V, --verifiable
                                construct verifiable messages
  -X, --index
                               Send messages on specified index for ULB sources
  -Y, --broker-index
                                Send messages on specified named index for broker
      sources
```
